

LMI INSPECTION, REPAIR, AND CALIBRATION

A functioning LMI system provides critical information to the crane operator to help ensure the safe operation of the crane.

The system monitors crane configuration, load, boom angle, track superelevation, and rotational position of the upper house as these all play a factor into the cranes stability.

IPS can inspect and repair these systems, as well as check and re-calibrate if needed. During this process, IPS technicians can provide training to operators and mechanics on their specific LMI system.
